

Shocking: People Do Not Die of Cancer! People Die of Chemotherapy and in Terrible Pain

Have you heard about Dr. Hardin B. Jones? He is the man who has dedicated his life to studying the effects of chemotherapy in cancer patients and exploring their life expectancy. He had worked as a professor of medical physics and physiology at Berkley College and his cancer-related studies have revealed something shocking.

According to Dr. Jones, the cancer industry, including Big Pharma, healthcare facilities, and doctors, only want to make profit out of the people's disease. In other words, when a patient accepts to undergo a conventional cancer treatment, the cancer industry makes money.

Dr. Jones claims that most cancer patients who undergo chemotherapy actually die in great pain. He also adds that those who undergo chemotherapy are likely to die much faster and painfully than those who refused any conventional treatment. As a matter of fact, he claims that patients who don't undergo chemotherapy live 12 years longer when compared to those who do.

After an extensive research on the topic, Dr. Jones concluded that conventional cancer treatment reduces life expectancy and speeds up the deterioration of the organism. Even though the cancer industry is aware of this fact, it still ignores it. Moreover, mass media are also allied with them and help them in their effort to keep the public in the dark.

The study was published in the *New York Academy of Sciences Journal* and it showed that breast cancer patients who didn't receive chemotherapy lived four times longer than those who did. Moreover, those who consider chemotherapy as their best option, usually die three years after being diagnosed with cancer, or even after a month or two.

In addition to this, a 1979 study published in the *American Medical Association Journal* has shown that the popular methods for diagnosing and treating cancer, most of which are used these days too, are ineffective for most patients. The same conclusion was brought by two separate studies from the same period, including a British study published in the *Lancet* 35. This study also found that even though numerous patients underwent chemotherapy, the survival rate of breast cancer patients hadn't increased. The same thing was stated by a study conducted in 1978 in Israel.

There is yet another person who dealt with analysis of this topic. Dr. Ulrich Abel, an eminent German epidemiologist, has done a thorough research of all the chemotherapy-related studies from all over the world. The results of the study have been published in a book entitled *The Doctor In The House* and everyone who is planning on undergoing chemotherapy should read them.

Chemotherapy as a type of cancer treatment focuses on the elimination of healthy cells with the aim of preventing spread of cancerous cells. Unfortunately, the fact that cancer patients die from this treatment and not from the effects of cancer, is hidden by the Big Pharma.

Most of the late cancer patients have died of malnutrition as cancer-affected cells absorb the nutrients from the body and disrupt the immune system. Eventually, the immune system is so weak that it loses its ability to protect itself from any external threat. Sadly, healthcare professionals still use chemotherapy, although the fact that it cannot cure breast cancer, colon cancer, or lung cancer, is backed up by science. According to Allen Levin, modern medicine already has the universal cure for cancer but it is hidden from the public. The reason behind this is clear: a single cancer treatment can cost up to \$ 1,000,000.
